The shades shown are intended as an indication only.

* Samples were exposed for 500 hours to a light spectrum equivalent to natural sunlight at midday, at the height of the summer on the earth's surface in the northern hemisphere. Differences in clarity, saturation and hue as compared to the reference sample kept in the dark in standard conditions are measured.

The resulting colour difference ΔE_f is used to calculate the grey scale intensity values for colour fastness (GSC), expressed in a range from 5 (maximum fastness) to 1.

Important: the human eye cannot distinguish colour differences in the 5 to 3 range.
